

I hope this sketch helps you see what we wish to make. It's adds a different dimension to the bed and brings the 'Alice in Wonderland' theme to life.

I've attached an illustration for the structure and a few details below. Please let me know if this is enough for you to talk to the planners. It will be highly robust and secure.

The height of the column will be (total) about 1600 mm above the raised bed. It will be secured at each point of the raised bed using a screwed flat plate with a concrete base below it. The structure will be made from tubular steel for the column (70 mm diameter and 3mm plate thickness) and 30x70mm steel box for the clock hands.

We will provide a suitable padlock to keep the hour hand in place. The minute hand will be welded to the column and secured to the raised bed in 3 places.

Hope this is enough detail.
